Project LMS - Module 1

Identity & User Management: how to start and launch the application

Start it

1. Start **Docker Desktop** and wait until it says the engine is running.
2. Start the containers, either way:
• **Docker Desktop:** open Containers, find the **learning-management-system** group (it may be hiding behind another item) and click Start.
• **Terminal:**

```
cd C:\Users\setlu\OneDrive\claudevscode\claudecode\learning-management-system
docker compose up -d
```

Note the space: **up -d**, not up-d.
3. Wait 30-60 seconds for the backend to finish starting. Signing in too early fails.
4. Open **http://localhost:8081** in your browser.

Sign in

Email **learner@lms.local**, password **Demo@12345678**.
Other demo users use the same password: instructor@lms.local, org.admin@lms.local, super.admin@lms.local, content.admin@lms.local, exam.admin@lms.local, event.admin@lms.local, finance.admin@lms.local, evaluator@lms.local, support.agent@lms.local.

Addresses

What	Address
Web app (UI)	http://localhost:8081
Backend API	http://localhost:8080/api/v1/identity
Backend health check	http://localhost:8080/actuator/health (expects {"status":"UP"})

Stop it

• **Docker Desktop:** click Stop on the group.
• **Terminal:**

```
docker compose down
```

Your data (including the demo users) is kept. Do **not** add -v unless you want to erase the database.

Useful commands (run in the project folder)

```
docker compose ps                 # status of the three containers
docker compose logs backend        # backend log (verification links and OTPs appear here)
docker compose up -d --build       # rebuild images after changing code
```

Trying registration

Email and SMS are not sent in this version. After registering, find the verification link in the backend log (lines starting with [DEV MAIL]) and open it in the browser.

Troubleshooting

• **"Cannot connect to the Docker API"**: Docker Desktop is not running. Start it and retry.
• **502 Bad Gateway or login errors right after starting**: the backend is still starting. Wait a minute.
• **Group not visible in Docker Desktop**: scroll the Containers list or search for "learning"; if needed, restart Docker Desktop.
• **Settings** (JWT secret, demo users, first admin) live in the .env file in the project folder.
